## 1 Packages, data and functions

### 1.1 Packages

```
library(tidyverse)
library(patchwork)
library(here)
library(lme4)
library(lmerTest)
```

### 1.2 Data

```
load(here("Data/3_ForecastsResults/3_MergedResults/complete.forecasts.RData"))

complete.forecasts.taxa <- complete.forecasts %>%
  dplyr::filter(
    forecast.method == "Simplex EDM",
    Target != "Total_biomass",
    Target != "Mean_oxygen"
  )
```

## 1.3 Functions

```
conf_interval <- function(model, nd, response, renameResponse, cmult=1.96){
  nd[,response] <- predict(model, nd, re.form=NA)
  mm <- model.matrix(terms(model),nd)
  pvar1 <- diag(mm %*% tcrossprod(vcov(model),mm))
  nd <- nd %>%
    dplyr::mutate(lower=!!as.name(response)-cmult*sqrt(pvar1),
                  upper=!!as.name(response)+cmult*sqrt(pvar1),
                  Response=renameResponse) %>%
    dplyr::rename(fit=!!as.name(response))
  return(nd)
}
```

## 2 Figure 2

### 2.1 Models

```
## acf vs exp
m.acf.exp <-
  lmer(
    acf_lag5 ~ median_richness_center * light_treatment +
      (1 | Target) + (1 | bottle) + (1 | incubator),
    complete.forecasts.taxa
  )

## cv vs exp
m.cv.exp <-
  lmer(
    cv.res.log10 ~ median_richness_center * light_treatment +
      (1 | Target) + (1 | bottle) + (1 | incubator),
    complete.forecasts.taxa
  )

### pe vs rmse
m.pe.exp <-
  lmer(
```

```

    pe5 ~ median_richness_center * light_treatment +
      (1 | Target) + (1 | bottle) + (1 | incubator),
    complete.forecasts.taxa
  )

## acf vs RMSE
m.acf.rmse <-
  lmer(
    RMSE ~ acf_lag5 * light_treatment +
      (1 | Target) + (1 | bottle) + (1 | incubator),
    complete.forecasts.taxa
  )

## CV vs RMSE
m.cv.rmse <-
  lmer(
    RMSE ~ cv.res.log10 * light_treatment +
      (1 | Target) + (1 | bottle) + (1 | incubator),
    complete.forecasts.taxa
  )

### pe vs rmse
m.pe.rmse <-
  lmer(
    RMSE ~ pe5 * light_treatment +
      (1 | Target) + (1 | bottle) + (1 | incubator),
    complete.forecasts.taxa
  )

```

## 2.2 Figure

```

newdat.m.exp <-

**Figure 2:** Relationship of time series metrics with forecast error (a-c), and with experimental treatments (d-f). Time series metrics are (a, d) autocorrelation at lag 5, (b, e) coefficient of variation as a measure of temporal variability, and (c, f) permutation entropy as a measure of time series complexity. Lines display the fit of the corresponding linear mixed model, shaded areas denote the 95% confidence intervals. Taxon, bottle, and incubator were included as random effects in the model. Forecast error is based on forecasts computed with Simplex EDM.

### 3 Versions of R and of the R-packages used

**R version:** R version 4.3.2 (2023-10-31).

**Base packages:** stats, graphics, grDevices, utils, datasets, methods, base.

**Other packages:** lmerTest 3.1-3, lme4 1.1-35.1, Matrix 1.6-5, here 1.0.1, patchwork 1.2.0, lubridate 1.9.3, forcats 1.0.0, stringr 1.5.1, dplyr 1.1.4, purrr 1.0.2, readr 2.1.5, tidyr 1.3.1, tibble 3.2.1, ggplot2 3.5.0, tidyverse 2.0.0, knitr 1.45.
